April 2026

Vionex Team,

The DeepX 2026 hackathon was the first time I built an Arabic Aspect-Based Sentiment Analysis system end-to-end under real-time pressure—12 hours, a real-world dataset, and no room for a partially working model. Finishing with 3rd place and receiving the Vionex internship opportunity was a rewarding outcome, but what stayed with me most was how Vionex positions itself: a MENA-focused team building Arabic-language AI and bridging the gap between research and real-world deployment. That is exactly the kind of work I want to grow into.

My experience spans building end-to-end AI systems across multiple domains, with a strong emphasis on turning models into usable, reliable pipelines. During my internship at the National Training Academy, I developed a CV ranking engine built on LLaMA 3.1, fine-tuned using LoRA. The system evaluates resumes against job descriptions, produces structured outputs, and handles multilingual input through language detection and translation pipelines. In the same role, I built an OCR pipeline for Egyptian National ID cards, covering detection, perspective correction, and field extraction, all optimized for noisy real-world images.

I have also worked on NLP-intensive tasks, including the Arabic ABSA system developed during the DeepX hackathon, as well as multimodal learning. My team achieved 1st place in Nile University's UGRF Competition with a classifier combining image, text, and tabular data. Across these projects, I work extensively with PyTorch, TensorFlow, OpenCV, and modern LLM tooling, including prompt engineering, embeddings, structured outputs, and fine-tuning workflows.

I am currently in my third year of a BSc in Artificial Intelligence at Nile University, maintaining a 3.98/4.0 GPA, and was honored with the 2025 Outstanding Academic Performance Award. Alongside my studies, I teach front-end development at Microsoft ASU and serve as a Junior Teaching Assistant at Nile University, mentoring over 50 students in OOP, debugging, and code review.

The hackathon provided a clear glimpse into how Vionex operates, and I would value the opportunity to contribute to building AI systems that are deployed to real users across the MENA region. I would be glad to discuss my projects in more detail.

Thank you for your time and consideration.

Sincerely,
Omar Amin Abdelrazek
